## Instant Issuance – Network Configuration

## Instant Issuance - Operation

Instant Issuance with the TRISM system - 6 easy steps:

1. The user will setup the customer's card base information and account information on the present system.
2. Upon completion of the account setup process, the user goes to the system and gets the next available card number that will be linked to the demand deposit account(s).
3. Next, the user will toggle to the TRISM system and select the <ENCODE & EMBOSS> option and enter the card number (auto-incrementation can usually be setup to automatically display the next available card number and expiration date in the TRISM screen).
4. The user then verifies the information and selects the <ENCODE> button and is prompted to have the customer enter their PIN number through a secure encrypted PIN pad.
5. Following the verification of PIN entered, the system will prompt the user to enter the customer name and a preview of the card is displayed for verification purposes.
6. Once the <FINISH> button is selected the card then goes to the security module to process and generate a PIN offset. The result is then archived in the TRISM reports and then displayed at the TRISM workstation activation purposes. The user enters the PIN offset in the existing system where indicated. (A card is then created in about 60sec).
